

STAKERX WHITEPAPER

Daily yield, made clear.

How StakerX, StakerGPT, 30-day stakes, compounding and referrals work. One guide you can read in ten minutes and share with anyone.

Device image is illustrative. Figures shown on screens are demo data.

Stake USDC.

Earn every day.

StakerX is a crypto staking platform. You open a 30-day stake in USDC and receive daily yield funded by StakerGPT, StakerX's own agentic trading system. You never place a trade or manage leverage. You see a simple product: a balance, your stakes, daily credits and withdrawals.

MINIMUM STAKE

\$10

Open as many stakes as you like

STAKE TERM

30 days

Principal unlocks at maturity

YIELD POSTS

Every 24h

On each stake's own cycle

STATED AVERAGE YIELD

1% to 3%

Per day, varies, not guaranteed

PERFORMANCE FEE

5%

Of each yield credit, shown in full

HELD AS

USDC

On Solana, whatever you deposit

13 Questions and official links

StakerX.io is built and operated by StakerX Strategies AG, Switzerland. This guide explains how the product works. It is not financial advice, and yield is never guaranteed. Please read the [risk disclosures](#) before you stake.

StakerGPT does the trading. You hold the stake.

StakerGPT is StakerX's proprietary agentic crypto-perpetuals trading system. Its trading performance is what funds the daily yield on active stakes.

◆ Model layer

Reads market structure and strategy context across crypto-perpetuals markets.

◆ Rule layer

Decides whether a reading is specific, measurable and controlled enough to become a signal.

◆ Trading operation

Approved setups are routed into StakerX's internal trading operation.

Results are published daily

Every day at 00:15 UTC, StakerGPT's session is posted trade by trade: market, direction, fills, times and return. Anyone can check it at stakerx.io/trades.

What stays private

The exact algorithm and training method are a trade secret. How results are produced is explained at stakerx.io/methodology.

How it reasons. StakerX is among the limited number of organizations with access to Claude Mythos. StakerGPT combines that access with a Claude Opus-family reasoning model, historical market analysis, live market inputs, deterministic execution rules and risk controls.

Trading involves risk, and past results do not predict future results. Read more at docs.stakerx.io/stakergpt.

From sign-up to first stake in three steps.

1

Create your account

Go to app.stakerx.io and sign in the way you prefer. There is no password to remember.

 Google

 Email code

 Solana wallet

2

Fund your balance

Send USDC on Solana straight to your personal deposit address, or use the multi-token option to deposit from 40+ tokens on major networks. Your balance is always held as USDC.

3

Open a stake

Choose an amount from \$10 and confirm. The 30-day term starts, and the first daily yield posts 24 hours after the stake activates.

WATCH THE VIDEO

See it done on screen

The getting-started video walks through sign-in, a deposit and a first stake. Scan the code or tap this card.

youtube.com/watch?v=hWd5WlycJL60

Tip for partners: this guide is the same for everyone. When you invite someone, send **your own referral link** alongside it so their sign-up is attributed to you.

Two ways in. One balance.

However you deposit, the result is the same: a USDC balance on Solana that you can stake from \$10.

GOOD TO KNOW

- **The deposit screen is the source of truth.** Supported tokens and networks can change, so always pick from what the deposit window shows on the day, and send only to the address it gives you for that exact token and network.
- **Costs.** For converted deposits, network and routing costs are taken in transit, and what arrives is credited. StakerX adds no extra fee for converting.
- **Amount.** Sending at least \$10 is recommended, which is also the minimum stake.

Full details: docs.stakerx.io/deposits

A credit every 24 hours, with the fee in plain sight.

StakerX states an average daily yield of 1% to 3% on active stakes. The rate applied to your stake varies from day to day and is never guaranteed.

ONE DAY ON A \$1,000 STAKE AT AN ASSUMED 2.00% GROSS RATE

HOW THAT DAY APPEARS IN YOUR TRANSACTION HISTORY (ILLUSTRATIVE)

Yield credit	+\$20.00
StakerGPT Performance Fee (5%)	-\$1.00

Your own 24-hour cycle

Each stake credits on its own clock, timed from the moment it activated, not at a fixed time of day. StakerGPT's public results post separately at 00:15 UTC.

The StakerGPT Performance Fee

5% of each yield credit. Yield posts gross, and the fee appears as its own line in your transaction history, so the net figure is always traceable.

Where does each day's net yield go?

AUTO-COMPOUND ON

Added to the stake itself, so tomorrow earns on a slightly larger amount. It stays committed until maturity. This is the default for new stakes.

AUTO-COMPOUND OFF

Lands in your available balance as it posts. Withdraw it (from \$10), hold it, or use it to open another stake.

Your applied rate, gross credit, fee and net gain are shown in the dashboard and in transaction details. The 5% performance fee is the standard fee. If any other fee applies to your account, it is shown before you confirm.

Same rate. Same 30 days. A different finish.

With auto-compound on, each day's net yield joins the stake, so the next day earns on a little more. The effect is small on day two and unmistakable by day thirty.

NET EARNINGS BY DAY ON A \$1,000 STAKE, AFTER THE 5% FEE

WITH DAILY COMPOUNDING

+\$758.84

stake value ends at \$1,758.84

WITHOUT COMPOUNDING

+\$570.00

principal plus earnings \$1,570.00

+\$188.84 from compounding

Assumptions: \$1,000 stake, 30 days, a constant **2% gross** daily yield, 5% performance fee, so **1.9% net** per day. 2% is an illustration, not a historical average or a promised rate.

HYPOTHETICAL

Why the gap widens

Without compounding, every day earns on the same \$1,000. With it, day 30 earns on about \$1,726.

The trade-off

Compounded yield stays committed until maturity. With auto-compound off you earn less, but your yield is available daily.

\$1,000 for 30 days, worked through.

STAKE	TERM	ASSUMED GROSS YIELD	FEE	NET RATE USED
\$1,000	30 days	2% daily, constant	5% of yield	1.9% daily

WITHOUT COMPOUNDING

\$570

net earnings

\$1,570

principal plus earnings

57%

net return

WITH DAILY COMPOUNDING

about \$758.84

net earnings

\$1,758.84

ending stake value

75.88%

net return

	WITHOUT COMPOUNDING		WITH DAILY COMPOUNDING	
	EARNED	TOTAL	EARNED	STAKE VALUE
Day 1	\$19.00	\$1,019.00	\$19.00	\$1,019.00
Day 5	\$95.00	\$1,095.00	\$98.68	\$1,098.68
Day 10	\$190.00	\$1,190.00	\$207.10	\$1,207.10
Day 15	\$285.00	\$1,285.00	\$326.21	\$1,326.21
Day 20	\$380.00	\$1,380.00	\$457.08	\$1,457.08
Day 25	\$475.00	\$1,475.00	\$600.86	\$1,600.86
Day 30	\$570.00	\$1,570.00	\$758.84	\$1,758.84

The formulas

Net rate: $2\% \times (1 - 0.05) = 1.9\%$

Without: $\$1,000 \times 1.9\% \times 30 =$

\$570

With: $\$1,000 \times 1.019^{30} = \$1,758.84$

Read this as a model

Real daily rates move, and your account terms, daily rounding to the cent and any other applicable fees change the outcome. Figures are rounded for display.

An ending stake value is not the same as a withdrawable balance. Compounded yield stays in the stake until maturity, and if auto-renew is left on, the matured amount rolls into a new 30-day stake instead of becoming available. See pages 9 and 10.

What happens to a stake, start to finish.

DAY 0

You open the stake

From \$10. The principal is committed for the full 30 days and cannot be withdrawn early.

DAYS 1 TO 30

Yield posts every 24 hours

Thirty credits over the term, each with its performance fee shown.

DAY 30

Maturity

The term ends. What happens next depends on your auto-renew setting.

At maturity, your principal does one of two things

AUTO-RENEW ON • DEFAULT

It opens a new 30-day stake

The matured amount, including anything that compounded into it, starts another term automatically. Nothing becomes available to withdraw.

AUTO-RENEW OFF

It unlocks to your available balance

Principal plus everything that compounded into it becomes available. Withdraw it, hold it, or open a new stake by hand.

Planning to withdraw at the end of a term? Switch auto-renew off on that stake before day 30. You can change the setting at any time while the stake is active, from the Stakes page.

Yield that was paid to your available balance during the term (auto-compound off) is already yours to use and is not affected by maturity. Full details: docs.stakerx.io/staking

Auto-compound grows a stake. Auto-renew repeats it.

They sound alike, but they answer different questions. Each stake has its own pair of switches, and both are on by default for new stakes.

Auto-compound

Where does daily yield go?

Works **during** the 30 days. On: net yield is added to the stake. Off: net yield goes to your available balance.

Auto-renew

What happens at maturity?

Works **at the end** of the 30 days. On: the matured amount starts a new stake. Off: it unlocks to your available balance.

Compound on

Compound off

Renew on

Hands-off growth

EACH DAY

Yield joins the stake.

ON DAY 30

The grown amount rolls into a new term and keeps compounding. Nothing unlocks.

Income, stake repeats

EACH DAY

Yield lands in available balance.

ON DAY 30

The principal starts a new term. Your daily income continues.

Renew off

Grow, then cash out

EACH DAY

Yield joins the stake.

ON DAY 30

Principal plus all compounded yield unlocks to your available balance.

Income, then principal

EACH DAY

Yield lands in available balance.

ON DAY 30

The principal unlocks to your available balance.

- A renewed stake keeps the auto-compound setting of the stake it came from.
- Switching auto-compound on applies from that moment forward. It does not go back and add earlier days.

Available balance is **yours to move**. Staked funds wait for maturity.

WHAT FLOWS INTO YOUR AVAILABLE BALANCE

Daily yield, when auto-compound is off

It lands as it posts and can be withdrawn during the term.

Referral rewards that have been credited

They are paid to your available balance.

Matured stakes, when auto-renew is off

Principal, plus any yield that compounded into the stake.

How to withdraw

Open Withdraw in the dashboard, enter the amount and your destination Solana wallet, review and submit. Eligible withdrawals are processed automatically on-chain.

The essentials

- ◆ Minimum withdrawal: **\$10**
- ◆ Always sent as **USDC on Solana**
- ◆ Any fee that applies is shown before you confirm

Keep your account safe: StakerX support never messages you first. See stakerx.io/security. Full details: docs.stakerx.io/withdrawals

Share StakerX. Earn on the stakes you bring in.

When someone you referred opens an eligible stake, you earn a reward set by the size of that individual stake. It is a direct program: one level, no network totals.

REFERRED USER'S STAKE	YOUR REWARD
\$10 to \$5,000	5%
\$5,001 to \$10,000	7%
\$10,001 to \$50,000	8%
\$50,001 to \$100,000	10%
\$100,001 and up	15%

Live schedule as published on 21 September 2026. Each stake sets its own tier. Example: a \$1,000 eligible stake earns a \$50 reward.

Welcome bonus for the person you invite

A referred customer gets **5% of their first deposit, up to \$100**, when they enter a referral code before their first deposit and within 7 days of signing up.

Conditions worth knowing

- Later eligible stakes by the same person can earn again. Not every renewal or re-stake qualifies, and amounts added by compounding do not earn referral rewards.
- Self-referrals and abusive patterns are not eligible.

This PDF does not carry your referral code. It is one universal guide. Find your personal link on the Referrals page of your dashboard and send it together with this guide, so the sign-up is credited to you.

Rates and rules can change. The live schedule is always at docs.stakerx.io/referrals, and the full conditions are in the [Terms of Service](#).

Short answers, no small print.

Is the daily yield guaranteed?

No. StakerX states an average of 1% to 3% per day, but the applied rate varies and can be lower. The 2% used in this guide is only an illustration.

Can I take my principal out before day 30?

No. Principal is committed for the full term. With auto-compound off, your daily yield is available during the term.

I left everything on default. What happens on day 30?

Both switches are on, so the grown stake renews for another 30 days and nothing unlocks. Turn auto-renew off before maturity if you want the funds available.

Is auto-renew the same as compounding?

No. Compounding adds daily yield to a stake during its term. Renewing starts a new term at maturity. You can use either, both or neither.

What does StakerX charge?

A 5% StakerGPT Performance Fee on each yield credit, shown as its own line. Any other fee that applies to your account is shown before you confirm.

Which coins can I deposit?

USDC on Solana directly, or 40+ tokens through the multi-token option. The deposit screen shows exactly what is supported today.

How do I get paid out?

Withdraw from your available balance, from \$10, to a Solana wallet. Withdrawals are always sent as USDC on Solana.

When does my first yield arrive?

24 hours after the stake activates, then every 24 hours on that stake's own cycle, for 30 credits in all.

Does this PDF contain a referral link?

No. It is the same for everyone. If someone sent it to you, ask for their referral link and enter their code before your first deposit.

Do I need to trade or watch the market?

No. StakerGPT trades inside StakerX. You can review its published results any time at stakerx.io/trades.
